1 IE login device

After powering on the fee collection management terminal and connecting to the Internet, open the computer browser (CHROME is recommended) and enter the device IP address in the address bar (the default terminal IP is 192.168.1.233. The computer IP and the terminal device must be in the same LAN. If you forget the device IP address, you can restore the default IP address by pressing and holding the device reset button for 10 seconds) and press Enter to access.

Enter the user name and password in the login box (the default user name is admin and the password is 123456) and click the login button to log in. The IE loading page is as shown below.

2Home

2.1 The home page provides statistics on the overall parking and operation conditions of the parking lot and displays them in a graphical form to facilitate parking lot management.

2.2 The online monitoring page can monitor the vehicles entering and leaving the parking lot in real time, and can remotely open the gate for abnormal vehicles.

3. System Configuration

After logging into the server terminal for the first time, you must first configure the system. The parking fee collection system can only work normally after completing the system configuration according to the actual situation of the parking lot. The system configuration includes the basic configuration of the parking lot operation. Click "System Settings" in the left menu bar to configure.

3.1 Basic Settings

Fill in the total parking space data and the number of fixed parking spaces according to the actual situation of the project. The fixed parking spaces are included in the remaining parking space statistics by default. Other parameters can use the default parameters or be modified according to the actual needs of the parking lot.

3.2 Vehicle type settings

You can follow up the actual needs of the parking lot to add multiple vehicle types for easy management. By default, five vehicle types are enabled: temporary vehicle A, monthly rental vehicle A, free vehicle A, stored-value vehicle A, and VIP. The vehicle's entry and exit mode can also be configured to be one in and one out, multiple ins and one out, or multiple ins and multiple outs. At the same time, the alias of the vehicle type can also be customized.

3.3. System notes settings

System notes can add reasons for abnormal situations such as "free release ", "abnormal release ", "abnormal entry "in advance, so that the booth personnel can choose to use them when judging the vehicle entering and leaving the site.

Basic settings	Cloudplat settings	Cartype settings	System notes	Database settings	Vehicle Model Management

3.4 Database Settings

- Back up the current database (including basic configuration information).
- 2 Restore the database and select a backed-up database to restore.
- ③ You can set a timer to clean up the entry information of vehicles that have been detained for too long.
- ④ You can set the time period for clearing exit records.

4. Parking lot settings

We use a tree structure to show the logical relationship between the hardware devices in a parking lot. There can be multiple booths under a parking lot (each booth corresponds to a super black box), and there can be multiple channels under the booths (usually one in and one out). Hardware devices such as license plate recognition cameras and control cards can be bound to the channels.

4.2 Channel Information Configuration

Click the corresponding channel node menu on the left, and the configuration information of the current channel will be displayed on the right. You can also modify the configuration information of the current channel. The parking lot channels are divided into entrance channels and exit channels. Each channel can be configured with access rights and access time periods for different license plates, whether to open the gate automatically or manually confirm the opening of the gate, and other configuration information.

The configuration information of the entry channel is as follows:

The configuration information of the export channel is as follows:

4.4 Control Card Configuration

Click the corresponding control card node menu on the left, and the configuration information of the current control card will be

displayed on the right. By changing the configuration, you can customize the content displayed when the LED is restored to default and the volume of voice playback.

5 Charging rules configuration

Click the charging rules menu on the left to set parking fee rules for different types of vehicles in the parking lot. It can support 5 charging methods (general natural day, day and night, 24 hours, segmented charging, weekdays and non-working days). Each charging method can independently set whether to charge on a per-time basis. These five charging methods can meet almost all parking lot needs.

5.1 General natural day charges

The general natural day charging mode is the normal charging method

- 1) Set the free time for a single day.
- (2) Set a maximum charge for a single day. When the charge for a single day exceeds the maximum charge, the maximum charge will prevail.
- ③ Set whether the multi-day billing includes the single-day free time and the first segment charge.
- ④ Set tiered charges based on parking duration
- (5) Set up pay-per-use parking
- (6) Configure whether to add overnight fees, and the time for adding overnight fees can be set.

Fee rules Holiday settings

	✓Save

5.3 24-hour charging

The 24-hour charging mode can accurately set different charging amounts for each time period, and can be refined to charge different charging standards for each hour or half hour.

5.4 Sectional Charging

The segmented charging mode can divide a day into multiple time periods to set different charging rules, and different charges can be set for multiple time periods at will.

Fee rules Holiday settings											
ChargingStandard list v C	Charge Segmented Name:		ChargingStan	idard Segmente	d

	Save										

5.5 Working day and non-working day charges

The working day and non-working day modes can distinguish different charging methods for working day time and non-working day time, and different charging rules for peak time and non-peak time can be set for working day.

5.6 Holiday Settings

You can set the time for holidays. If you set another day as a holiday, the day will be charged as a non-working day.

7.2 Coupon Management-Discounts

You can check the vehicles on site and actively distribute coupons to them, and you can check the coupon collection records.

8. User Rights Management

8.1 User Rights Management - Role Management

You can add or delete roles, and configure different permissions for different roles to facilitate permission management. The system preassigns permissions for three different roles: "Administrator ", " Analyst "and "Operator ".

10.3 Report Statistics-Charge Statistics

The charges within a time period can be reported and counted according to time. The statistics include the total amount to be receivable for temporary vehicles, the total amount of exemption for temporary vehicles, the total amount actually collected for temporary vehicles, the total amount of recharge for fixed vehicles, and the total amount of central charges. These reports can also be exported and printed.

10.4 Report Statistics - Charge Report by Operator

You can search by time, and make reports on the overall situation of parking lot operators in a certain period of time, including the operator's total amount collected, total discount, total actual amount collected, total order amount, which can be exported and printed.

10.5 Report Statistics-Charge Report by Time

Based on time search, you can make reports and statistics on the overall daily situation, including the total amount receivable, total discount, total amount received, and total order amount for the day, which can be exported and printed.

11. Terminal Management

11.1 Terminal Management-Network Settings

Network settings are the configuration of the basic network parameters of the terminal device itself. This menu can modify the basic network information of the terminal device. After the device is started, the IP address of the terminal should generally be modified first according to the system situation.

- ① Set the terminal device's IP, subnet mask, default gateway, etc.
- ② The MAC address is the unique identification number of the terminal device.
- ③ Router address and port settings
- (4) You can ping the license plate recognition camera on the same LAN to determine the network connection status

11.2 Terminal Management-Time Settings

This menu can modify the time information of the terminal device. Before the system runs, you need to set the time of the server version terminal device. When the server version terminal device is started again, it will synchronize the time of all devices in the system to keep the system time consistent.

① Current local time

2 You can modify the time manually or obtain the time from the Internet

11.3 Terminal Management-Monitoring Style

This menu can modify the display resolution of the terminal output. When some displays cannot support higher resolutions, you can configure a lower resolution output (the default resolution is 1920*1080).

(1) You can upload a picture with a resolution of 1920*1080 as the main page picture for the device login

2 You can set the device output resolution to fit the current screen

11.4 Terminal Management-System Maintenance

This menu can be used to maintain and upgrade the terminal

1 If you want to set a usage period for the device, you can generate a registration code for it.

② System upgrades can be performed on terminal devices

③ The default parameters of the terminal device can be restored. If the terminal is a server version, the factory settings can be fully restored or partially restored. Complete factory settings will restore all configurations of the device, while partial factory settings will only restore the parking lot configuration, and the network and login configuration of the device will remain unchanged.

④ You can restart the terminal device

(5) You can check the option to log in automatically, and the system will automatically log in when the device restarts.
